AMINO ACID HYDROXYETHYLAMINO  
SULFONAMIDE RETROVIRAL PROTEASE INHIBITORS

RELATED CASE

This is a continuation-in-part of co-owned and co-pending application Serial No. 08/402,287, filed March 10, 1995 which is incorporated herein by reference in its entirety.

10

BACKGROUND OF THE INVENTION

The present invention relates to retroviral protease inhibitors and, more particularly, relates to novel 15 compounds, composition and method for inhibiting retroviral proteases, such as human immunodeficiency virus (HIV) protease. This invention, in particular, relates to amino acid hydroxyethylamine sulfonamide protease inhibitor compounds, composition and method for 20 inhibiting retroviral proteases, prophylactically preventing retroviral infection or the spread of a retrovirus, and treatment of a retroviral infection, e.g., an HIV infection. The subject invention also relates to processes for making such compounds as well as 25 to intermediates useful in such processes.

During the replication cycle of retroviruses, gag and gag-pol gene transcription products are translated as proteins. These proteins are subsequently processed by a 30 virally encoded protease (or proteinase) to yield viral enzymes and structural proteins of the virus core. Most commonly, the gag precursor proteins are processed into the core proteins and the pol precursor proteins are processed into the viral enzymes, e.g., reverse 35 transcriptase and retroviral protease. It has been shown that correct processing of the precursor proteins by the retroviral protease is necessary for assembly of

infectious viroids. For example, it has been shown that frameshift mutations in the protease region of the pol gene of HIV prevents processing of the gag precursor protein. It has also been shown through site-directed 5 mutagenesis of an aspartic acid residue in the HIV protease active site that processing of the gag precursor protein is prevented. Thus, attempts have been made to inhibit viral replication by inhibiting the action of retroviral proteases.

10

Retroviral protease inhibition typically involves a transition-state mimetic whereby the retroviral protease is exposed to a mimetic compound which binds (typically in a reversible manner) to the enzyme in competition with 15 the gag and gag-pol proteins to thereby inhibit specific processing of structural proteins and the release of retroviral protease itself. In this manner, retroviral replication proteases can be effectively inhibited.

20

Several classes of compounds have been proposed, particularly for inhibition of proteases, such as for inhibition of HIV protease. Such compounds include hydroxyethylamine isosteres and reduced amide isosteres. See, for example, EP 0 346 847; EP 0 342,541; Roberts et 25 al, "Rational Design of Peptide-Based Proteinase Inhibitors, " *Science*, 248, 358 (1990); and Erickson et al, "Design Activity, and 2.8 $\text{\AA}$  Crystal Structure of a C2 Symmetric Inhibitor Complexed to HIV-1 Protease, " *Science*, 249, 527 (1990). US 5,157,041, WO 94/04491, WO 30 94/04492, WO 94/04493, WO 94/05639, WO 92/08701 and US Patent Application Serial No. 08/294,468, filed August 23, 1994, (each of which is incorporated herein by reference in its entirety) for example describe hydroxyethylamine, hydroxyethylurea or hydroxyethyl 35 sulfonamide isostere containing retroviral protease inhibitors.

Several classes of compounds are known to be useful as inhibitors of the proteolytic enzyme renin. See, for example, U.S. No. 4,599,198; U.K. 2,184,730; G.B. 2,209,752; EP O 264 795; G.B. 2,200,115 and U.S. SIR 5 H725. Of these, G.B. 2,200,115, GB 2,209,752, EP O 264,795, U.S. SIR H725 and U.S. 4,599,198 disclose urea-containing hydroxyethylamine renin inhibitors. EP 468 10 641 discloses renin inhibitors and intermediates for the preparation of the inhibitors, which include sulfonamide-containing hydroxyethylamine compounds, such as 3-(t-butoxycarbonyl)amino-cyclohexyl-1-(phenylsulfonyl)amino-2(5)-butanol. G.B. 2,200,115 also discloses sulfamoyl-containing hydroxyethylamine renin inhibitors, and EP 0264 15 795 discloses certain sulfonamide-containing hydroxyethylamine renin inhibitors. However, it is known that, although renin and HIV proteases are both classified as aspartyl proteases, compounds which are effective renin inhibitors generally are not predictive for effective HIV protease inhibition.

## SCHEME I

a) deprotection; X = Cl or Br.

## SCHEME II

a) deprotection;  $X = Cl$  or  $Br$ ;  $L$  = leaving group.

An N-protected chloroketone derivative of an amino acid having the formula:

wherein P represents an amino protecting group, and R<sup>2</sup> is as defined above, is reduced to the corresponding alcohol 5 utilizing an appropriate reducing agent. Suitable amino protecting groups are well known in the art and include carbobenzoxy, t-butoxycarbonyl, and the like. A preferred amino protecting group is carbobenzoxy. A preferred N-protected chloroketone is

10 N-benzyloxycarbonyl-L-phenylalanine chloromethyl ketone. A preferred reducing agent is sodium borohydride. The reduction reaction is conducted at a temperature of from -10°C to about 25°C, preferably at about 0°C, in a suitable solvent system such as, for example,

15 tetrahydrofuran, and the like. The N-protected chloroketones are commercially available, e.g., such as from Bachem, Inc., Torrance, California. Alternatively, the chloroketones can be prepared by the procedure set forth in S. J. Fittkau, J. Prakt. Chem., 315, 1037

20 (1973), and subsequently N-protected utilizing procedures which are well known in the art.

The halo alcohol can be utilized directly, as described below, or, preferably, is reacted, preferably 25 at room temperature, with a suitable base in a suitable solvent system to produce an N-protected amino epoxide of the formula:

wherein P and R<sup>2</sup> are as defined above. Suitable solvent systems for preparing the amino epoxide include ethanol, methanol, isopropanol, tetrahydrofuran, dioxane, and the like including mixtures thereof. Suitable bases for 5 producing the epoxide from the reduced chloroketone include potassium hydroxide, sodium hydroxide, potassium t-butoxide, DBU and the like. A preferred base is potassium hydroxide.

10 Alternatively, a protected amino epoxide can be prepared, such as in co-owned and co-pending PCT Patent Application Serial No. PCT/US93/04804 (WO 93/23388) and PCT/US94/12201, and US Patent Application Attorney Docket No. C-2860, each of which is incorporated herein by 15 reference in their entirety) disclose methods of preparing chiral epoxide, chiral cyanohydrin, chiral amine and other chiral intermediates useful in the preparation of retroviral protease inhibitors, starting with a DL-, D- or L-amino acid which is reacted with a 20 suitable amino-protecting group in a suitable solvent to produce an amino-protected amino acid ester. For the purposes of illustration, a protected L-amino acid with the following formula will be used to prepare the inhibitors of this invention:

25

wherein P<sup>3</sup> represents carboxyl-protecting group, e.g., 30 methyl, ethyl, benzyl, tertiary-butyl, 4-methoxyphenylmethyl and the like; R<sup>2</sup> is as defined above; and P<sup>1</sup> and P<sup>2</sup> and/or P' independently are selected from amine protecting groups, including but not limited to, aralkyl, substituted aralkyl, cycloalkenylalkyl and substituted cycloalkenylalkyl, allyl, substituted allyl,

acyl, alkoxycarbonyl, aralkoxycarbonyl and silyl. Examples of aralkyl include, but are not limited to benzyl, ortho-methylbenzyl, trityl and benzhydryl, which can be optionally substituted with halogen, alkyl of 5 C<sub>1</sub>-C<sub>8</sub>, alkoxy, hydroxy, nitro, alkylene, amino, alkylamino, acylamino and acyl, or their salts, such as phosphonium and ammonium salts. Preferably P<sup>1</sup> and P<sup>2</sup> are independently selected from aralkyl and substituted aralkyl. More preferably, each of P<sup>1</sup> and P<sup>2</sup> is benzyl.

Additionally, the P<sup>1</sup> and/or P<sup>2</sup> and/or P' protecting 20 groups can form a heterocyclic ring with the nitrogen to which they are attached, for example, 1,2-bis(methylene)benzene, phthalimidyl, succinimidyl, maleimidyl and the like and where these heterocyclic groups can further include adjoining aryl and cycloalkyl 25 rings. In addition, the heterocyclic groups can be mono-, di- or tri-substituted, e.g., nitrophthalimidyl. The term silyl refers to a silicon atom optionally substituted by one or more alkyl, aryl and aralkyl groups.

30

Suitable silyl protecting groups include, but are not limited to, trimethylsilyl, triethylsilyl, tri-isopropylsilyl, tert-butyldimethylsilyl, dimethylphenylsilyl, 1,2-bis(dimethylsilyl)benzene, 35 1,2-bis(dimethylsilyl)ethane and diphenylmethylsilyl. Silylation of the amine functions to provide mono- or bis-disilylamine can provide derivatives of the

aminoalcohol, amino acid, amino acid esters and amino acid amide. In the case of amino acids, amino acid esters and amino acid amides, reduction of the carbonyl function provides the required mono- or bis-silyl 5 aminoalcohol. Silylation of the aminoalcohol can lead to the N,N,O-tri-silyl derivative. Removal of the silyl function from the silyl ether function is readily accomplished by treatment with, for example, a metal hydroxide or ammonium flouride reagent, either as a 10 discrete reaction step or in situ during the preparation of the amino aldehyde reagent. Suitable silylating agents are, for example, trimethylsilyl chloride, tert-butyldimethylsilyl chloride, phenyldimethylsilyl chloride, diphenylmethylsilyl chloride or their combination 15 products with imidazole or DMF. Methods for silylation of amines and removal of silyl protecting groups are well known to those skilled in the art. Methods of preparation of these amine derivatives from corresponding amino acids, amino acid amides or amino acid esters are 20 also well known to those skilled in the art of organic chemistry including amino acid/amino acid ester or aminoalcohol chemistry.

The amino-protected L-amino acid ester is then 25 reduced, to the corresponding alcohol. For example, the amino-protected L-amino acid ester can be reduced with diisobutylaluminum hydride at -78° C in a suitable solvent such as toluene. Preferred reducing agents include lithium aluminium hydride, lithium borohydride, 30 sodium borohydride, borane, lithium tri-ter-butoxyaluminum hydride, borane/THF complex. Most preferably, the reducing agent is diisobutylaluminum hydride (DiBAL-H) in toluene. The resulting alcohol is then converted, for example, by way of a Swern oxidation, 35 to the corresponding aldehyde of the formula:

wherein  $P^1$ ,  $P^2$  and  $R^2$  are as defined above. Thus, a 5 cooled (-75 to -68° C) solution of oxalyl chloride in dichloromethane and DMSO in dichloromethane and stirred for 35 minutes.

Acceptable oxidizing reagents include, for example, 10 sulfur trioxide-pyridine complex and DMSO, oxalyl chloride and DMSO, acetyl chloride or anhydride and DMSO, trifluoroacetyl chloride or anhydride and DMSO, methanesulfonyl chloride and DMSO or tetrahydro thiophene-S-oxide, toluenesulfonyl bromide and DMSO, 15 trifluoromethanesulfonyl anhydride (triflic anhydride) and DMSO, phosphorus pentachloride and DMSO, dimethylphosphoryl chloride and DMSO and isobutyl chloroformate and DMSO. The oxidation conditions reported by Reetz et al [*Angew Chem.*, 99, p. 1186, 20 (1987)], [*Angew Chem. Int. Ed. Engl.*, 26, p. 1141, 1987) employed oxalyl chloride and DMSO at -78°C.

The preferred oxidation method described in this invention is sulfur trioxide pyridine complex, 25 triethylamine and DMSO at room temperature. This system provides excellent yields of the desired chiral protected amino aldehyde usable without the need for purification i.e., the need to purify kilograms of intermediates by chromatography is eliminated and large scale operations 30 are made less hazardous. Reaction at room temperature also eliminated the need for the use of low temperature reactor which makes the process more suitable for commercial production.

The reaction may be carried out under an inert atmosphere such as nitrogen or argon, or normal or dry air, under atmospheric pressure or in a sealed reaction vessel under positive pressure. Preferred is a nitrogen atmosphere. Alternative amine bases include, for example, tri-butyl amine, tri-isopropyl amine, N-methylpiperidine, N-methyl morpholine, azabicyclononane, diisopropylethylamine, 2,2,6,6-tetramethylpiperidine, N,N-dimethylaminopyridine, or mixtures of these bases.

5 Triethylamine is a preferred base. Alternatives to pure DMSO as solvent include mixtures of DMSO with non-protic or halogenated solvents such as tetrahydrofuran, ethyl acetate, toluene, xylene, dichloromethane, ethylene dichloride and the like. Dipolar aprotic co-solvents

10 include acetonitrile, dimethylformamide, dimethylacetamide, acetamide, tetramethyl urea and its cyclic analog, N-methylpyrrolidone, sulfolane and the like. Rather than N,N-dibenzylphenylalaninol as the aldehyde precursor, the phenylalaninol derivatives

15 discussed above can be used to provide the corresponding N-monosubstituted [either P<sup>1</sup> or P<sup>2</sup> = H] or N,N-disubstituted aldehyde.

20

In addition, hydride reduction of an amide or ester derivative of the corresponding benzyl (or other suitable protecting group) nitrogen protected phenylalanine, substituted phenylalanine or cycloalkyl analog of phenylalanine derivative can be carried out to provide the aldehydes. Hydride transfer is an additional method

25

30 of aldehyde synthesis under conditions where aldehyde condensations are avoided, cf, Oppenauer Oxidation.

The aldehydes of this process can also be prepared by methods of reducing protected phenylalanine and phenylalanine analogs or their amide or ester derivatives by, e.g., sodium amalgam with HCl in ethanol or lithium or sodium or potassium or calcium in ammonia. The reaction temperature may be from about -20°C to about

35

45°C, and preferably from about 5°C to about 25°C. Two additional methods of obtaining the nitrogen protected aldehyde include oxidation of the corresponding alcohol with bleach in the presence of a catalytic amount of 5 2,2,6,6-tetramethyl-1-pyridyloxy free radical. In a second method, oxidation of the alcohol to the aldehyde is accomplished by a catalytic amount of tetrapropylammonium perruthenate in the presence of N-methylmorpholine-N-oxide.

10

Alternatively, an acid chloride derivative of a protected phenylalanine or phenylalanine derivative as disclosed above can be reduced with hydrogen and a catalyst such as Pd on barium carbonate or barium 15 sulphate, with or without an additional catalyst moderating agent such as sulfur or a thiol (Rosenmund Reduction).

The aldehyde resulting from the Swern oxidation is 20 then reacted with a halomethyl lithium reagent, which reagent is generated *in situ* by reacting an alkyl lithium or aryl lithium compound with a dihalomethane represented by the formula  $X^1CH_2X^2$  wherein  $X^1$  and  $X^2$  independently represent I, Br or Cl. For example, a solution of the 25 aldehyde and chloroiodomethane in THF is cooled to -78°C and a solution of n-butyllithium in hexane is added. The resulting product is a mixture of diastereomers of the corresponding amino-protected epoxides of the formulas:

The diastereomers can be separated e.g., by chromatography, or, alternatively, once reacted in subsequent steps the diastereomeric products can be

separated. A D-amino acid can be utilized in place of the L-amino acid in order to prepare compounds having an (S) stereochemistry at the carbon bonded to R<sup>2</sup>.

5        The addition of chloromethyl lithium or bromomethyl lithium to a chiral amino aldehyde is highly diastereoselective. Preferably, the chloromethyl lithium or bromomethyl lithium is generated in-situ from the reaction of the dihalomethane and n-butyllithium.

10      Acceptable methyleneating halomethanes include chloroiodomethane, bromochloromethane, dibromomethane, diiodomethane, bromofluoromethane and the like. The sulfonate ester of the addition product of, for example, hydrogen bromide to formaldehyde is also a methyleneating agent. Tetrahydrofuran is the preferred solvent, however alternative solvents such as toluene, dimethoxyethane, ethylene dichloride, methylene chloride can be used as pure solvents or as a mixture. Dipolar aprotic solvents such as acetonitrile, DMF, N-methylpyrrolidone are useful

15      as solvents or as part of a solvent mixture. The reaction can be carried out under an inert atmosphere such as nitrogen or argon. For n-butyl lithium can be substituted other organometallic reagents reagents such as methyllithium, tert-butyl lithium, sec-butyl lithium,

20      phenyllithium, phenyl sodium and the like. The reaction can be carried out at temperatures of between about -80°C to 0°C but preferably between about -80°C to -20°C. The most preferred reaction temperatures are between -40°C to -15°C. Reagents can be added singly but multiple

25      additions are preferred in certain conditions. The preferred pressure of the reaction is atmospheric however a positive pressure is valuable under certain conditions such as a high humidity environment.

30      Alternative methods of conversion to the epoxides of this invention include substitution of other charged methylenation precursor species followed by their treatment with base to form the analogous anion.

35

Examples of these species include trimethylsulfoxonium tosylate or triflate, tetramethylammonium halide, methyldiphenylsulfoxonium halide wherein halide is chloride, bromide or iodide.

5

The conversion of the aldehydes of this invention into their epoxide derivative can also be carried out in multiple steps. For example, the addition of the anion of thioanisole prepared from, for example, a butyl or 10 aryl lithium reagent, to the protected aminoaldehyde, oxidation of the resulting protected aminosulfide alcohol with well known oxidizing agents such as hydrogen peroxide, tert-butyl hypochlorite, bleach or sodium periodate to give a sulfoxide. Alkylation of the 15 sulfoxide with, for example, methyl iodide or bromide, methyl tosylate, methyl mesylate, methyl triflate, ethyl bromide, isopropyl bromide, benzyl chloride or the like, in the presence of an organic or inorganic base. Alternatively, the protected aminosulfide alcohol can be 20 alkylated with, for example, the alkylating agents above, to provide a sulfonium salts that are subsequently converted into the subject epoxides with tert-amine or mineral bases.

25

The desired epoxides formed, using most preferred conditions, diastereoselectively in ratio amounts of at least about an 85:15 ratio (S:R). The product can be purified by chromatography to give the diastereomerically and enantiomerically pure product but it is more 30 conveniently used directly without purification to prepare retroviral protease inhibitors. The foregoing process is applicable to mixtures of optical isomers as well as resolved compounds. If a particular optical isomer is desired, it can be selected by the choice of 35 starting material, e.g., L-phenylalanine, D-phenylalanine, L-phenylalaninol, D-phenylalaninol, D-hexahydrophenylalaninol and the like, or resolution can occur at intermediate or final steps. Chiral auxiliaries

such as one or two equivalents of camphor sulfonic acid, citric acid, camphoric acid, 2-methoxyphenylacetic acid and the like can be used to form salts, esters or amides of the compounds of this invention. These compounds or 5 derivatives can be crystallized or separated chromatographically using either a chiral or achiral column as is well known to those skilled in the art.

The amino epoxide is then reacted, in a suitable 10 solvent system, with an equal amount, or preferably an excess of, a desired amine of the formula  $R^3NH_2$ , wherein  $R^3$  is hydrogen or is as defined above. The reaction can be conducted over a wide range of temperatures, e.g., from about 10°C to about 100°C, but is preferably, but 15 not necessarily, conducted at a temperature at which the solvent begins to reflux. Suitable solvent systems include protic, non-protic and dipolar aprotic organic solvents such as, for example, those wherein the solvent is an alcohol, such as methanol, ethanol, isopropanol, 20 and the like, ethers such as tetrahydrofuran, dioxane and the like, and toluene,  $N,N$ -dimethylformamide, dimethyl sulfoxide, and mixtures thereof. A preferred solvent is isopropanol. The resulting product is a 3-( $N$ -protected 25 amino)-3-( $R^2$ )-1-( $NHR^3$ )-propan-2-ol derivative (hereinafter referred to as an amino alcohol) can be represented by the formulas:

30 wherein  $P$ ,  $P^1$ ,  $P^2$ ,  $R^2$  and  $R^3$  are as described above. Alternatively, a haloalcohol can be utilized in place of the amino epoxide.

The amino alcohol defined above is then reacted in a suitable solvent with the sulfonyl chloride  $R^4SO_2Cl$ , the sulfonyl bromide  $R^4SO_2Br$  or the corresponding sulfonyl anhydride, preferably in the presence of an acid

5 scavenger. Suitable solvents in which the reaction can be conducted include methylene chloride, tetrahydrofuran and the like. Suitable acid scavengers include triethylamine, pyridine and the like. The resulting sulfonamide derivative can be represented, depending on

10 the epoxide utilized by the formulas

wherein P, P<sub>1</sub>, P<sub>2</sub>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> are as defined above.

15 These intermediates are useful for preparing inhibitor compounds of the present invention.

The sulfonyl halides of the formula  $R^4SO_2X$  can be prepared by the reaction of a suitable aryl, heteroaryl and benzo fused heterocyclo Grignard or lithium reagents with sulfonyl chloride, or sulfur dioxide followed by oxidation with a halogen, preferably chlorine. Aryl, heteroaryl and benzo fused heterocyclo Grignard or lithium reagents can be prepared from their corresponding

20 halide (such as chloro or bromo) compounds which are commercially available or readily prepared from commercially available starting materials using known methods in the art. Also, thiols may be oxidized to sulfonyl chlorides using chlorine in the presence of

25 water under carefully controlled conditions.

Additionally, sulfonic acids, such as arylsulfonic acids, may be converted to sulfonyl halides using reagents such as  $PCl_5$ ,  $SOCl_2$ ,  $ClC(O)C(O)Cl$  and the like, and also to anhydrides using suitable dehydrating reagents. The

30

sulfonic acids may in turn be prepared using procedures well known in the art. Some sulfonic acids are commercially available. In place of the sulfonyl halides, sulfinyl halides ( $R^4SOX$ ) or sulfenyl halides (5  $R^4SX$ ) can be utilized to prepare compounds wherein the  $-SO_2-$  moiety is replaced by an  $-SO-$  or  $-S-$  moiety, respectively. Arylsulfonic acids, benzo fused heterocyclo sulfonic acids or heteroaryl sulfonic acids can be prepared by sulfonation of the aromatic ring by 10 well known methods in the art, such as by reaction with sulfuric acid,  $SO_3$ ,  $SO_3$  complexes, such as  $DMF(SO_3)$ , pyridine( $SO_3$ ),  $N,N$ -dimethylacetamide( $SO_3$ ), and the like. Preferably, arylsulfonyl halides are prepared from 15 aromatic compounds by reaction with  $DMF(SO_3)$  and  $SOCl_2$  or  $ClC(O)C(O)Cl$ . The reactions may be performed stepwise or in a single pot.

Arylsulfonic acids, benzo fused heterocyclo sulfonic acids, heteroaryl sulfonic acids, arylmercaptans, benzo fused heterocyclo mercaptans, heteroarylmercaptans, 20 arylhalides, benzo fused heterocyclo halides, heteroarylhalides, and the like are commercially available or can be readily prepared from starting materials commercially available using standard methods 25 well known in the art. For example, a number of sulfonic acids ( $R^4SO_3H$ ) represented by the formulas

wherein A, B, Z,  $R^6$ ,  $R^7$  and  $R^9$  are as defined above, have been prepared from 1,2-benzenedithiol, 2-mercaptopanphenol, 30 1,2-benzenediol, 2-aminobenzothiazole, benzothiazole, 2-aminobenzimidazole, benzimidazole, and the like, which are commercially available, by Carter, US Patent 4,595,407; Ehrenfreund et al., US Patent 4,634,465; Yoder et al., J. 5 A1, each of which are incorporated herein by reference in their entirety. For example, 1,2-benzenedithiol, 2-mercaptophenol or 1,2-benzenediol can be reacted with R<sup>6</sup>R<sup>7</sup>C(L')<sub>2</sub>, where L' is as defined below, preferably, Br or I, in the presence of a base, such as hydroxide, or 10 R<sup>6</sup>R<sup>7</sup>C=O in the presence of acid, such as toluenesulfonic acid, or P<sub>2</sub>O<sub>5</sub>, to prepare the substituted benzo fused heterocycle of formula

15 which can then be sulfonylated to the sulfonic acid above. For example, CF<sub>2</sub>Br<sub>2</sub> or CD<sub>2</sub>Br<sub>2</sub> can be reacted with 1,2-benzenedithiol, 2-mercaptophenol or 1,2-benzenediol in the presence of base to produce the compounds

20 respectively, wherein A and B are O or S and D is a deuterium atom. Also, when A and/or B represent S, the sulfur can be oxidized using the methods described below to the sulfone or sulfoxide derivatives.

Following preparation of the sulfonamide derivative, 25 the amino protecting group P or P<sup>1</sup> and P<sup>2</sup> amino protecting groups are removed under conditions which will not affect the remaining portion of the molecule. These methods are well known in the art and include acid hydrolysis, hydrogenolysis and the like. A preferred 30 method involves removal of the protecting group, e.g., removal of a carbobenzoxy group, by hydrogenolysis utilizing palladium on carbon in a suitable solvent system such as an alcohol, acetic acid, and the like or mixtures thereof. Where the protecting group is a t-

butoxycarbonyl group, it can be removed utilizing an inorganic or organic acid, e.g., HCl or trifluoroacetic acid, in a suitable solvent system, e.g., dioxane or methylene chloride. The resulting product is the amine 5 salt derivative.

Following neutralization of the salt, the amine is then coupled to the DL-, D-, or L-amino acid corresponding to the formula  $\text{PNHCH}(\text{R}^1)\text{COOH}$ , wherein P and 10  $\text{R}^1$  are as defined above, followed by deprotection of the amine as described above, and coupling to

wherein  $\text{R}^{10}$  and  $\text{R}^{11}$  are as defined above, W is a leaving group, such as mesylate, bromo or chloro, and L is 15 leaving group such as halide, anhydride, active ester, and the like. For example when  $\text{R}^{10}$  and  $\text{R}^{11}$  are both hydrogen radical, bromoacetyl halide, chloroacetyl halide or the corresponding anhydride can be used. Finally, reacting the above intermediate with the cyclic-amine of 20 formula

can produce the antiviral compounds of the present invention having the formula

25 wherein n, R1, R2, R3, R4, R10, R11, R12, R13 and R14 are as defined above. Amines of formula

are commercially available, such as pyrrolidine, 2-pyrrolidinemethanol, 3-pyrrolidinol, 2-(methoxymethyl)pyrrolidine, kainic acid, piperidine, 3-5 hydroxypiperidine, 4-hydroxypiperidine, 2-piperidinemethanol, 2,3-dihydroindole, isoindoline, 1,2,3,4-tetrahydroisoquinoline, 1,2,3,4-tetrahydroquinoline, and the like; or can readily be prepared from commercially available starting materials 10 using standard methods well known in the art, such as 4-hydroxyproline, 3-hydroxypiperidine, 4-hydroxypiperidine, 3-pyrroline, isonipecotic acid, 5-hydroxyindole, 5-hydroxyindole-3-acetic acid, 5,6-dimethoxyindole, isoquinoline, quinoline, 5-hydroxyisoquinoline, 8-15 hydroxy-5-nitroquinoline, 6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline, and the like.

Alternatively, following neutralization of the salt, the amine is then coupled to the DL-, D-, or L-amino acid 20 corresponding to the formula  $\text{PNHCH}(\text{R}1)\text{COOH}$ , wherein P and R1 are as defined above, followed by deprotection of the amine as described above and coupling the deprotected amine to the cyclic-amino acid of formula

25 wherein n, R10, R11, R12, R13 and R14 are as defined above, such as pyrrolidin-1-ylacetic acid, piperidin-1-ylacetic acid and the like, to produce the antiviral compounds of the present invention. The cyclic-amino acids are commercially available or are readily prepared

from a protected carboxylic acid with a leaving group W (defined above) by reaction with the cyclic-amine as shown in Scheme III or alternatively, by reacting the cyclic-amine with the appropriate substituted ketone in 5 the presence of cyanide anion followed by hydrolysis of the cyano group to the corresponding carboxylic acid as shown in Scheme IV, wherein n, P3, R10, R11, R12, R13 and R14 are as defined above..

Scheme IV

Alternatively, following neutralization of the salt, the amine is then coupled to the DL-, D-, or L-amino acid 20 corresponding to the formula

wherein n, R1, R10, R11, R12, R13 and R14 are as defined above, which can be prepared in a similar fashion to the 5 coupling methods described above from DL-, D-, or L-amino acid corresponding to the formula  $\text{NH}_2\text{CH}(\text{R}^1)\text{COOP}^3$ , wherein  $\text{P}^3$  and  $\text{R}^1$  are as defined above.

The DL-, D-, or L-amino acid corresponding to the 10 formula  $\text{PNHCH}(\text{R}^1)\text{COOH}$  or  $\text{NH}_2\text{CH}(\text{R}^1)\text{COOP}^3$ , wherein P,  $\text{P}^3$  and  $\text{R}^1$  are as defined above, are commercially available (Sigma Chemical Co.), or readily prepared using standard methods well known in the art from readily available starting materials. Preferably, P is a benzyloxycarbonyl 15 or t-butoxycarbonyl radical and  $\text{P}^3$  is benzyl or tert-butyl radicals. Standard coupling procedures can be used to couple the amino acids and amines. The carboxylic acid group is reacted to form an anhydride, mixed anhydride, acid halide, such as chloride or bromide, or 20 active ester, such as esters of N-hydroxysuccinimide, HOBT and the like, using well known procedures and conditions. Appropriate solvent systems include tetrahydrofuran, ethylether, methyl-tert-butylether, methylene chloride, N,N-dimethylformamide and the like, 25 including mixtures thereof.

Alternatively, the protected amino alcohol from the 30 epoxide opening can be further protected at the newly introduced amino group with a protecting group P' which is not removed with the removal of the amino protecting groups P or  $\text{P}^1$  and  $\text{P}^2$ , for example, P' is selectively removable. One skilled in the art can choose appropriate combinations of P', P,  $\text{P}^1$  and  $\text{P}^2$ . For example, suitable combinations are P = Cbz and P' = Boc; P' = Cbz and P =

Boc;  $P^1 = Cbz$ ,  $P^2 =$  benzyl and  $P' = Boc$ ; and  $P^1 = P^2 =$  benzyl and  $P' = Boc$ . The resulting compound represented by the formula

can be carried through the remainder of the synthesis to provide a compound of the formula

wherein  $n$ ,  $P'$ ,  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^{10}$ ,  $R^{11}$ ,  $R^{12}$ ,  $R^{13}$ ,  $R^{14}$  are as defined above. The remainder of the synthesis above can be carried out as desired either by the addition of 15 desired residues or groups one at a time or in a preformed molecule made up of more than one residue or group in one step. The former approach is the sequential synthesis method and the latter is the convergent synthesis method. Synthetic transformations are possible 20 at this stage also. The protecting group  $P'$  is then selectively removed and the resulting amine is reacted with the sulfonyl chloride  $R^4SO_2Cl$ , the sulfonyl bromide  $R^4SO_2Br$  or the corresponding sulfonyl anhydride, preferably in the presence of an acid scavenger, to form 25 the compounds of the present invention

wherein n, R1, R2, R3, R<sup>4</sup>, R10, R11, R12, R13, R14 are as defined above. This selective deprotection and conversion to the sulfonamide can be accomplished at either the end of the synthesis or at any appropriate 5 intermediate step if desired.

The chemical reactions described above are generally disclosed in terms of their broadest application to the preparation of the compounds of this 10 invention. Occasionally, the reactions may not be applicable as described to each compound included within the disclosed scope. The compounds for which this occurs will be readily recognized by those skilled in the art. In all such cases, either the reactions can be 15 successfully performed by conventional modifications known to those skilled in the art, e.g., by appropriate protection of interfering groups, by changing to alternative conventional reagents, by routine modification of reaction conditions, and the like, or 20 other reactions disclosed herein or otherwise conventional, will be applicable to the preparation of the corresponding compounds of this invention. In all preparative methods, all starting materials are known or readily prepared from known starting materials.

25

Without further elaboration, it is believed that one skilled in the art can, using the preceding description, utilize the present invention to its fullest extent. All reagents were used as received without 35 purification. All proton and carbon NMR spectra were obtained on either a Varian VXR-300 or VXR-400 nuclear magnetic resonance spectrometer.

EXAMPLE 1

10 Preparation of 2S-[Bis(phenylmethyl)amino]benzenepropanol

METHOD 1: 2S-[Bis(phenylmethyl)amino]benzenepropanol from the DIBAL Reduction of N,N-bis(phenylmethyl)-L-Phenylalanine phenylmethyl ester

15

Step 1:

A solution of L-phenylalanine (50.0 g, 0.302 mol), sodium hydroxide (24.2 g, 0.605 mol) and potassium carbonate (83.6 g, 0.605 mol) in water (500 mL) was 20 heated to 97°C. Benzyl bromide (108.5 mL, 0.605 mol) was then slowly added (addition time - 25 min). The mixture was stirred at 97°C for 30 minutes under a nitrogen atmosphere. The solution was cooled to room temperature and extracted with toluene (2 x 250 mL). The combined 25 organic layers were washed with water and brine, dried over magnesium sulfate, filtered and concentrated to an oil. The identity of the product was confirmed as follows. Analytical TLC (10% ethyl acetate/hexane, silica gel) showed major component at R<sub>f</sub> value = 0.32 to 30 be the desired tribenzylated compound, N,N-bis(phenylmethyl)-L-phenylalanine phenylmethyl ester. This compound can be purified by column chromatography (silica gel, 15% ethyl acetate/hexane). Usually the

product is pure enough to be used directly in the next step without further purification.  $^1\text{H}$  NMR spectrum was in agreement with published literature.  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$ , 3.00 and 3.14 (ABX-system, 2H,  $J_{\text{AB}}=14.1$  Hz,  $J_{\text{AX}}=7.3$  Hz and  $J_{\text{BX}}=5.9$  Hz), 3.54 and 3.92 (AB-System, 4 H,  $J_{\text{AB}}=13.9$  Hz), 3.71 (t, 1H,  $J=7.6$  Hz), 5.11 and 5.23 (AB-System, 2H,  $J_{\text{AB}}=12.3$  Hz), and 7.18 (m, 20 H). EIMS: m/z 434 (M-1).

10 Step 2:

The benzylated phenylalanine phenylmethyl ester (0.302 mol) from the previous reaction was dissolved in toluene (750 mL) and cooled to -55°C. A 1.5 M solution of DIBAL in toluene (443.9 mL, 0.666 mol) was added at a rate to maintain the temperature between -55 to -50°C (addition time - 1 hr). The mixture was stirred for 20 minutes under a nitrogen atmosphere and then quenched at -55°C by the slow addition of methanol (37 ml). The cold solution was then poured into cold (5°C) 1.5 N HCl solution (1.8 L). The precipitated solid (approx. 138 g) was filtered off and washed with toluene. The solid material was suspended in a mixture of toluene (400 mL) and water (100 ml). The mixture was cooled to 5°C and treated with 2.5 N NaOH (186 mL) and then stirred at room temperature until solid dissolved. The toluene layer was separated from the aqueous phase and washed with water and brine, dried over magnesium sulfate, filtered and concentrated to a volume of 75 mL (89 g). Ethyl acetate (25 mL) and hexane (25 mL) were added to the residue upon which the desired alcohol product began to crystallize. After 30 min, an additional 50 mL hexane were added to promote further crystallization. The solid was filtered off and washed with 50 mL hexane to give 34.9 g of first crop product. A second crop of product (5.6 g) was isolated by refiltering the mother liquor. The two crops were combined and recrystallized from ethyl acetate (20 mL) and hexane (30 mL) to give 40 g of  $\beta\beta\text{-2-[Bis(phenylmethyl)amino]benzenepropanol}$ , 40% yield from

L-phenylalanine. An additional 7 g (7%) of product can be obtained from recrystallization of the concentrated mother liquor. TLC of product  $R_f$  = 0.23 (10% ethyl acetate/hexane, silica gel);  $^1H$  NMR ( $CDCl_3$ )  $\delta$  2.44 (m, 5 1H, ), 3.09 (m, 2H), 3.33 (m, 1H), 3.48 and 3.92 (AB-System, 4H,  $J_{AB}$  = 13.3 Hz), 3.52 (m, 1H) and 7.23 (m, 15H);  $[\alpha]_{D}^{25}$  +42.4 (c 1.45,  $CH_2Cl_2$ ); DSC 77.67°C; Anal. Calcd. for  $C_{23}H_{25}ON$ : C, 83.34; H, 7.60; N, 4.23. Found: C, 83.43; H, 7.59; N, 4.22. HPLC on chiral stationary phase: Cyclobond I SP column (250 x 4.6 mm I.D.), mobile phase: methanol/triethyl ammonium acetate buffer pH 4.2 (58:42, v/v), flow-rate of 0.5 ml/min, detection with detector at 230nm and a temperature of 0°C. Retention time: 11.25 min., retention time of the desired product enantiomer: 12.5 min.

METHOD 2: Preparation of  $\beta$ S-2-[Bis(phenylmethyl)amino]benzene-propanol from the N,N-Dibenzylation of L-Phenylalaninol

20                   L-phenylalaninol (176.6 g, 1.168 mol) was added  
to a stirred solution of potassium carbonate (484.6 g,  
3.506 mol) in 710 mL of water. The mixture was heated to  
65°C under a nitrogen atmosphere. A solution of benzyl  
25 bromide (400 g, 2.339 mol) in 3A ethanol (305 mL) was added  
at a rate that maintained the temperature between 60-68°C.  
The biphasic solution was stirred at 65°C for 55 min and  
then allowed to cool to 10°C with vigorous stirring. The  
oily product solidified into small granules. The product  
30 was diluted with 2.0 L of tap water and stirred for 5  
minutes to dissolve the inorganic by products. The product  
was isolated by filtration under reduced pressure and  
washed with water until the pH is 7. The crude product  
obtained was air dried overnight to give a semi-dry solid  
35 (407 g) which was recrystallized from 1.1 L of ethyl  
acetate/heptane (1:10 by volume). The product was isolated  
by filtration (at -8°C), washed with 1.6 L of cold (-10°C  
) ethyl acetate/heptane (1:10 by volume) and air-dried to

give 339 g (88% yield) of 2S-2-[Bis(phenylmethyl)amino]benzene-propanol, Mp = 71.5-73.0°C. More product can be obtained from the mother liquor if necessary. The other analytical characterization was 5 identical to compound prepared as described in Method 1.

#### EXAMPLE 2

10 Preparation of 2S-[Bis(phenylmethyl)amino]benzenepropanaldehyde

METHOD 1:

2S-[Bis(phenylmethyl)amino]benzene-propanol 15 (200 g, 0.604 mol) was dissolved in triethylamine (300 mL, 2.15 mol). The mixture was cooled to 12°C and a solution of sulfur trioxide/pyridine complex (380 g, 2.39 mol) in DMSO (1.6 L) was added at a rate to maintain the temperature between 8-17°C (addition time - 1.0 h). The 20 solution was stirred at ambient temperature under a nitrogen atmosphere for 1.5 hour at which time the reaction was complete by TLC analysis (33% ethyl acetate/hexane, silica gel). The reaction mixture was cooled with ice water and quenched with 1.6 L of cold 25 water (10-15°C) over 45 minutes. The resultant solution was extracted with ethyl acetate (2.0 L), washed with 5% citric acid (2.0 L), and brine (2.2 L), dried over MgSO<sub>4</sub> (280 g) and filtered. The solvent was removed on a rotary evaporator at 35-40°C and then dried under vacuum 30 to give 198.8 g of 2S-[Bis-(phenylmethyl)amino]-benzenepropanaldehyde as a pale yellow oil (99.9%). The crude product obtained was pure enough to be used directly in the next step without purification. The

## METHOD 2:

A solution of oxalyl chloride (8.4 ml, 0.096 mol) in dichloromethane (240 ml) was cooled to  $-74^\circ\text{C}$ . A solution of DMSO (12.0 ml, 0.155 mol) in dichloromethane 20 (50 ml) was then slowly added at a rate to maintain the temperature at  $-74^\circ\text{C}$  (addition time ~1.25 hr). The mixture was stirred for 5 min. followed by addition of a solution of  $\alpha\text{S-2-[bis(phenylmethyl)amino]benzene-propanol}$  (0.074 mol) in 100 ml of dichloromethane (addition time 25 -20 min., temp.  $-75^\circ\text{C}$  to  $-68^\circ\text{C}$ ). The solution was stirred at  $-78^\circ\text{C}$  for 35 minutes under a nitrogen atmosphere. Triethylamine (41.2 ml, 0.295 mol) was then added over 10 min. (temp.  $-78^\circ$  to  $-68^\circ\text{C}$ ) upon which the ammonium salt precipitated. The cold mixture was stirred 30 for 30 min. and then water (225 ml) was added. The dichloromethane layer was separated from the aqueous phase and washed with water, brine, dried over magnesium sulfate, filtered and concentrated. The residue was diluted with ethyl acetate and hexane and then filtered 35 to further remove the ammonium salt. The filtrate was concentrated to give  $\alpha\text{S-[bis(phenylmethyl)amino]benzenepropanaldehyde}$ . The aldehyde was carried on to the next step without purification.

## METHOD 3:

To a mixture of 1.0 g(3.0 mmoles) of BS-2-[bis(phenylmethyl)amino]benzenepropanol 0.531 g(4.53 mmoles) of N-methyl morpholine, 2.27 g of molecular sieves(4A) and 9.1 mL of acetonitrile was added 53 mg (0.15 mmoles) of tetrapropylammonium perruthenate(TPAP).  
5 The mixture was stirred for 40 minutes at room temperature and concentrated under reduced pressure. The residue was suspended in 15 mL of ethyl acetate, filtered through a pad of silica gel. The filtrate was concentrated under reduced pressure to give a product containing approximately 50% of  $\alpha$ S-2-[bis(phenylmethyl)amino]benzene propanaldehyde as a pale  
10 yellow oil.  
15

## METHOD 4:

To a solution of 1.0 g (3.02 mmoles) of BS-2-[bis(phenylmethyl)amino]benzenepropanol in 9.0 mL of toluene was added 4.69 mg(0.03 mmoles) of 2,2,6,6-tetramethyl-1-piperidinyloxy, free radical (TEMPO),  
20 0.32g(3.11 mmoles) of sodium bromide, 9.0 mL of ethyl acetate and 1.5 mL of water. The mixture was cooled to 0 °C and an aqueous solution of 2.87 mL of 5% household bleach containing 0.735 g(8.75 mmoles) of sodium bicarbonate and 8.53 mL of water was added slowly over 25 minutes. The mixture was stirred at 0 °C for 60 minutes. Two more additions (1.44 mL each) of bleach was added followed by stirring for 10 minutes. The two phase  
25 mixture was allowed to separate. The aqueous layer was extracted twice with 20 mL of ethyl acetate. The combined organic layer was washed with 4.0 mL of a solution containing 25 mg of potassium iodide and water(4.0 mL), 20 mL of 10% aqueous sodium thiosulfate  
30 solution and then brine solution. The organic solution was dried over magnesium sulfate, filtered and concentrated under reduced pressure to give 1.34g of crude oil containing a small amount of the desired  
35

product aldehyde,  $\alpha$ S-[bis(phenylmethyl)amino]benzenepropanaldehyde.

METHOD 5:

5 Following the same procedures as described in Method 1 of this Example except 3.0 equivalents of sulfur trioxide pyridine complex was used and  $\alpha$ S-[bis(phenylmethyl)amino]benzenepropanaldehyde was isolated in comparable yields.

EXAMPLE 3

15 Preparation of N,N-dibenzyl-3(S)-amino-1,2-(S)-epoxy-4-phenylbutane

METHOD 1:

A solution of  $\alpha$ S-[Bis(phenylmethyl)amino]benzenepropanaldehyde (191.7 g, 0.58 mol) and chloroiodomethane (56.4 mL, 0.77 mol) in tetrahydrofuran (1.8 L) was cooled to -30 to -35°C (colder temperature such as -70°C also worked well but warmer temperatures are more readily achieved in large scale operations) in a stainless steel reactor under a nitrogen atmosphere. A solution of n-butyl lithium in hexane (1.6 M, 365 mL, 0.58 mol) was then added at a rate that maintained the temperature below -25°C. After addition the mixture was stirred at -30 to -35°C for 10 minutes. More additions of reagents were carried out in the following manner: (1) additional chloroiodomethane (17 mL) was added, followed by n-butyl lithium (110 mL) at < -25°C. After addition the mixture was stirred at -30 to -35°C for 10 minutes. This was

repeated once. (2) Additional chloroiodomethane (8.5 mL, 0.11 mol) was added, followed by n-butyl lithium (55 mL, 0.088 mol) at <-25°C. After addition the mixture was stirred at -30 to -35°C for 10 minutes. This was 5 repeated 5 times. (3) Additional chloroiodomethane (8.5 mL, 0.11 mol) was added, followed by n-butyl lithium (37 mL, 0.059 mol) at <-25°C. After addition the mixture was stirred at -30 to -35°C for 10 minutes. This was repeated once. The external cooling was stopped and the 10 mixture warmed to ambient temp. over 4 to 16 hours when TLC (silica gel, 20% ethyl acetate/hexane) indicated that the reaction was completed. The reaction mixture was cooled to 10°C and quenched with 1452 g of 16% ammonium chloride solution (prepared by dissolving 232 g of 15 ammonium chloride in 1220 mL of water), keeping the temperature below 23°C. The mixture was stirred for 10 minutes and the organic and aqueous layers were separated. The aqueous phase was extracted with ethyl acetate (2x 500 mL). The ethyl acetate layer was 20 combined with the tetrahydrofuran layer. The combined solution was dried over magnesium sulfate (220g), filtered and concentrated on a rotary evaporator at 65°C. The brown oil residue was dried at 70°C in vacuo (0.8 bar) for 1 h to give 222.8 g of crude material. (The 25 crude product weight was >100%. Due to the relative instability of the product on silica gel, the crude product is usually used directly in the next step without purification). The diastereomeric ratio of the crude mixture was determined by proton NMR: (2S)/(2R): 86:14. 30 The minor and major epoxide diastereomers were characterized in this mixture by tlc analysis (silica gel, 10% ethyl acetate/hexane), Rf = 0.29 & 0.32, respectively. An analytical sample of each of the diastereomers was obtained by purification on silica-gel 35 chromatography (3% ethyl acetate/hexane) and characterized as follows:

**METHOD 2:**

25     A solution of the crude aldehyde 0.074 mol and chloroiodomethane (7.0 ml, 0.096 mol) in tetrahydrofuran (285 ml) was cooled to -78°C, under a nitrogen atmosphere. A 1.6 M solution of n-butyl lithium in hexane (25 ml, 0.040 mol) was then added at a rate to maintain the temperature at -75°C (addition time - 15 min.). After the first addition, additional chloroiodomethane (1.6 ml, 0.022 mol) was added again, followed by n-butyl lithium (23 ml, 0.037 mol), keeping the temperature at -75°C. The mixture was stirred for 15 min. Each of the reagents, chloroiodomethane (0.70 ml, 0.010 mol) and n-butyl lithium (5 ml, 0.008 mol) were added 4 more times over 45 min. at -75°C. The cooling bath was then removed and the solution warmed to 22°C

over 1.5 hr. The mixture was poured into 300 ml of saturated aq. ammonium chloride solution. The tetrahydrofuran layer was separated. The aqueous phase was extracted with ethyl acetate (1 x 300 ml). The 5 combined organic layers were washed with brine, dried over magnesium sulfate, filtered and concentrated to give a brown oil (27.4 g). The product could be used in the next step without purification. The desired diastereomer can be purified by recrystallization at a subsequent 10 step. The product could also be purified by chromatography.

METHOD 3:

A solution of  $\alpha$ S-[Bis(phenylmethyl)amino]benzene-15 propanaldehyde (178.84 g, 0.54 mol) and bromochloromethane (46 mL, 0.71 mol) in tetrahydrofuran (1.8 L) was cooled to -30 to -35°C (colder temperature such as -70°C also worked well but warmer temperatures are more readily achieved in large scale operations) in a 20 stainless steel reactor under a nitrogen atmosphere. A solution of n-butyl lithium in hexane (1.6 M, 340 mL, 0.54 mol) was then added at a rate that maintained the temperature below -25°C. After addition the mixture was stirred at -30 to -35°C for 10 minutes. More additions 25 of reagents were carried out in the following manner: (1) additional bromochloromethane (14 mL) was added, followed by n-butyl lithium (102 mL) at < -25°C. After addition the mixture was stirred at -30 to -35°C for 10 minutes. This was repeated once. (2) Additional 30 bromochloromethane (7 mL, 0.11 mol) was added, followed by n-butyl lithium (51 mL, 0.082 mol) at <-25°C. After addition the mixture was stirred at -30 to -35°C for 10 minutes. This was repeated 5 times. (3) Additional bromochloromethane (7 mL, 0.11 mol) was added, followed 35 by n-butyl lithium (51 mL, 0.082 mol) at <-25°C. After addition the mixture was stirred at -30 to -35°C for 10 minutes. This was repeated once. The external cooling

was stopped and the mixture warmed to ambient temp. over 4 to 16 hours when TLC (silica gel, 20% ethyl acetate/hexane) indicated that the reaction was completed. The reaction mixture was cooled to 10°C and 5 quenched with 1452 g of 16% ammonium chloride solution (prepared by dissolving 232 g of ammonium chloride in 1220 mL of water), keeping the temperature below 23°C. The mixture was stirred for 10 minutes and the organic and aqueous layers were separated. The aqueous phase was 10 extracted with ethyl acetate (2x 500 mL). The ethyl acetate layer was combined with the tetrahydrofuran layer. The combined solution was dried over magnesium sulfate (220 g), filtered and concentrated on a rotary evaporator at 65°C. The brown oil residue was dried at 15 70°C in vacuo (0.8 bar) for 1 h to give 222.8 g of crude material.

METHOD 4:

Following the same procedures as described in Method 20 3 of this Example except the reaction temperatures were at -20°C. The resulting N,N,αS-tris(phenylmethyl)-2S-oxiranemethanamine was a diastereomeric mixture of lesser purity than that of Method 3.

25 METHOD 5:

Following the same procedures as described in Method 3 of this Example except the reaction temperatures were at -70--78°C. The resulting N,N,αS-tris(phenylmethyl)-2S-oxiranemethanamine was a diastereomeric mixture, which 30 was used directly in the subsequent steps without purification.

METHOD 6:

Following the same procedures as described in Method 35 3 of this Example except a continuous addition of bromochloromethane and n-butyl lithium was used at -30 to -35°C. After the reaction and work up procedures as

described in Method 3 of this Example, the desired N,N, $\alpha$ S-tris(phenylmethyl)-2S-oxiranemethanamine was isolated in comparable yields and purities.

5 METHOD 7:

Following the same procedures as described in Method 2 of this Example except dibromomethane was used instead of chloroiodomethane. After the reaction and work up procedures as described in Method 2 of this Example, the 10 desired N,N, $\alpha$ S-tris(phenylmethyl)-2S-oxirane-methanamine was isolated.

An analytical sample of the desired major diastereomeric product was obtained by purifying a small sample of crude product by silica gel chromatography (40% ethyl acetate/hexane). Tlc analysis: silica gel, 40% ethyl acetate/hexane;  $R_f$  = 0.28; HPLC analysis: ultrasphere ODS column, 25% triethylamino-/phosphate buffer pH 3-acetonitrile, flow rate 1 mL/min, UV detector; retention time 7.49 min.; HRMS Calcd for  $C_{28}H_{27}N_2O$  ( $M + 1$ ) 417.616, found 417.2887. An analytical sample of the minor diastereomeric product, 3S-[N,N-bis(phenylmethyl)amino]-1-(2-methylpropyl)amino-4-phenylbutan-2S-ol was also obtained by purifying a small sample of crude product by silica gel chromatography (40% ethyl acetate/hexane).

Alternatively, oxalic acid dihydrate (119g, 0.94 mole) was added to a 5000 mL round bottom flask fitted 15 with a mechanical stirrer and a dropping funnel. Methanol (1000 ml) was added and the mixture stirred until dissolution was complete. A solution of crude 3(S)-[N,N-bis(phenylmethyl)amino]-1-(2-methylpropyl) amino-4-phenylbutan-2(R)-ol in ethyl acetate (1800 ml, 20 0.212g amino alcohol isomers/mL, 0.9160 moles) was added over a twenty minute period. The mixture was stirred for 18 hours and the solid product was isolated by centrifugation in six portions at 400G. Each portion was washed with 125 mL of ethyl acetate. The salt was then 25 collected and dried overnight at 1 torr to yield 336.3 g of product (71% based upon total amino alcohol). HPLC/MS (electrospray) was consistent with the desired product (m/z 417 [M+H]<sup>+</sup>).

The mixture was stirred for about 2 hours. The resulting 35 solid was filtered, washed with cold MTBE and dried to yield 2.1 g of white solid of about 98.9% diastereomerically pure (based on HPLC peak areas).

#### Preparation of 1,3-benzodioxole-5-sulfonyl chloride

##### Method 1:

25 To a solution of 4.25 g of anhydrous N,N-dimethylformamide at 0°C under nitrogen was added 7.84g of sulfonyl chloride, whereupon a solid formed. After stirring for 15 minutes, 6.45 g of 1,3-benzodioxole was added, and the mixture heated at 100°C for 2 hours. The 30 reaction was cooled, poured into ice water, extracted with methylene chloride, dried over magnesium sulfate, filtered and concentrated to give 7.32 g of crude material as a black oil. This was chromatographed on silica gel using 20% methylene chloride/hexane to afford 35 1.9 g of (1,3-benzodioxol-5-yl)sulfonyl chloride.

## Method 2:

To a 22 liter round bottom flask fitted with a mechanical stirrer, a cooling condenser, a heating mantle and a pressure equalizing dropping funnel was added sulfur trioxide DMF complex (2778g, 18.1 moles). Dichloroethane (4 liters) was then added and stirring initiated. 1,3-Benzodioxole (1905g, 15.6 moles) was then added through the dropping funnel over a five minute period. The temperature was then raised to 75°C and held for 22 hours (NMR indicated that the reaction was done after 9 hours.) The reaction was cooled to 26° and oxalyl chloride (2290g, 18.1 moles) was added at a rate so as to maintain the temperature below 40°C (1.5 hours). The mixture was heated to 67°C for 5 hours followed by cooling to 16°C with an ice bath. The reaction was quenched with water (5 l) at a rate which kept the temperature below 20°C. After the addition of water was complete, the mixture was stirred for 10 minutes. The layers were separated and the organic layer was washed again twice with water (5l). The organic layer was dried with magnesium sulfate (500g) and filtered to remove the drying agent. The solvent was removed under vacuum at 50°C. The resulting warm liquid was allowed to cool at which time a solid began to form. After one hour, the solid was washed with hexane (400 mL), filtered and dried to provide the desired sulfonyl chloride (2823g). The hexane wash was concentrated and the resulting solid washed with 400 mL hexane to provide additional sulfonyl chloride (464g). The total yield was 3287g (95.5% based upon 1,3-benzodioxole).

Preparation of 1-[N-[(1,3-benzodioxol-5-yl)sulfonyl]-N-(2-methylpropyl)aminol-3(S)-amino-4-phenyl-2(R)-butanol·methanesulfonic acid salt

10

Method 1:

Crude 1-[N-[(1,3-benzodioxol-5-yl)sulfonyl]-N-(2-methylpropyl)amino]-3(S)-[bis(phenylmethyl)amino]-4-phenyl-2(R)-butanol (6.2g, 0.010 moles) was dissolved in methanol (40 mL). Methanesulfonic acid (0.969g, 0.010 moles) and water (5 mL) were then added to the solution. The mixture was placed in a 500 mL Parr hydrogenation bottle containing 20% Pd(OH)<sub>2</sub> on carbon (255 mg, 50% water content). The bottle was placed in the hydrogenator and purged 5 times with nitrogen and 5 times with hydrogen. The reaction was allowed to proceed at 35°C with 63 PSI hydrogen pressure for 18 hours. Additional catalyst (125 mg) was added and, after purging, the hydrogenation continued for an additional 20 hours. The mixture was filtered through celite which was washed with methanol (2 X 10 mL). Approximately one third of the methanol was removed under reduced pressure. The remaining methanol was removed by azeotropic distillation with toluene at 80 torr. Toluene was added in 15, 10, 10 and 10 mL portions. The product crystallized from the

mixture and was filtered and washed twice with 10 mL portions of toluene. The solid was dried at room temperature at 1 torr for 6 hours to yield the amine salt (4.5 g, 84%). HPLC/MS (electrospray) was consistent with 5 the desired product (m/z 421 [M+H]<sup>+</sup>).

Method 2:

Part A: N-[3(S)-[N,N-bis(phenylmethyl)amino]-2(R)-hydroxy-4-phenylbutyl]-N-isobutylamine-oxalic acid salt 10 (2800g, 5.53 moles) and THF (4L) were added to a 22L round bottom flask fitted with a mechanical stirrer. Potassium carbonate (1921g, 13.9 moles) was dissolved in water (2.8L) and added to the THF slurry. The mixture was then stirred for one hour. 1,3-benzodioxole-5-sulfonyl 15 chloride (1281g, 5.8 moles) was dissolved in THF (1.4L) and added to the reaction mixture over 25 minutes. An additional 200 mL of THF was used to rinse the addition funnel. The reaction was allowed to stir for 14 hours and then water (4 L) was added. This mixture was stirred 20 for 30 minutes and the layers allowed to separate. The layers was removed and the aqueous layer washed twice with THF (500 mL). The combined THF layers were dried with magnesium sulfate (500 g) for one hour. This solution was then filtered to remove the drying agent and 25 used in subsequent reactions.

Part B: To the THF solution of crude 1-[N-[(1,3-benzodioxol-5-yl)sulfonyl]-N-(2-methylpropyl)amino]-3(S)-[bis(phenylmethyl)amino]-4-phenyl-2(R)-butanol was added 30 water (500 mL) followed by methane sulfonic acid (531g, 5.5 moles). The solution was stirred to insure complete mixing and added to a 5 gallon autoclave. Pearlman's catalyst (200g of 20% Pd(OH)<sub>2</sub> on C/ 50% water) was added to the autoclave with the aid of THF (500 mL). The reactor was purged four times with nitrogen and four 35 times with hydrogen. The reactor was charged with 60 psig of hydrogen and stirring at 450 rpm started. After 16 hours, HPLC analysis indicated that a small amount of

the mono-benzyl intermediate was still present. Additional catalyst (50g) was added and the reaction was allowed to run overnight. The solution was then filtered through celite (500g) to remove the catalyst and 5 concentrated under vacuum in five portions. To each portion, toluene (500 mL) was added and removed under vacuum to azeotropically removed residual water. The resulting solid was divided into three portions and each washed with methyl *t*-butyl ether (2 L) and filtered. The 10 residual solvent was removed at room temperature in a vacuum oven at less than 1 torr to yield the 2714g of the expected salt.

If desired, the product can be further purified by the following procedure. A total of 500 mL of methanol 15 and 170g of material from above was heated to reflux until it all dissolved. The solution was cooled, 200 mL of isopropanol added and then 1000-1300 mL of hexane, whereupon a white solid precipitated. After cooling to 0°C, this precipitate was collected and washed with 20 hexane to afford 123g of the desired material. Through this procedure, the original material which was a 95:5 mixture of alcohol diastereomers was greater than 99:1 of the desired diastereomer.

5 (the reaction was conducted behind a shield as a precaution) and after 2 hr., a red precipitate was deposited in the reaction vessel. The reaction mixture was filtered hot, and the solid was washed with dioxane and was dried. The solid was recrystallized from

10 methanol-water. A small amount of a precipitate was formed after 2 days. The precipitate was filtered off and the mother liquor was concentrated in vacuo to afford a pale red-orange solid (8.0 g, 85%) of pure product.

15 Part D: Preparation of 6-Chlorosulfonylbenzothiazole

Thionyl chloride (4 mL) was added to a suspension of the benzothiazole-6-sulfonic acid (0.60 g, 2.79 mmol) in dichloroethane (15 mL) and the reaction mixture was

20 heated at reflux and dimethylformamide (5 mL) was added to the reaction mixture to yield a clear solution. After 1.5 hr. at reflux, the solvent was removed in vacuo and excess HCl and thionyl chloride was chased by evaporation with dichloroethane.

## EXAMPLE 60

The compounds of the present invention are effective HIV protease inhibitors. Utilizing an enzyme assay as described below, the compounds set forth in the examples herein disclosed inhibited the HIV enzyme. The preferred compounds of the present invention and their calculated IC<sub>50</sub> (inhibiting concentration 50%, i.e., the concentration at which the inhibitor compound reduces enzyme activity by 50%) values are shown in Tables 20 and 21. The enzyme method is described below. The substrate is 2-Ile-Nle-Phe(p-NO<sub>2</sub>)-Gln-ArgNH<sub>2</sub>. The positive control is MVT-101 (Miller, M. et al, *Science*, 246, 1149 (1989))

The assay conditions are as follows:

Assay buffer: 20 mM sodium phosphate, pH 6.4  
20% glycerol  
1 mM EDTA  
5 1 mM DTT  
0.1% CHAPS

The above described substrate is dissolved in DMSO, then  
diluted 10 fold in assay buffer. Final substrate  
concentration in the assay is 80  $\mu$ M. HIV protease is  
10 diluted in the assay buffer to a final enzyme  
concentration of 12.3 nanomolar, based on a molecular  
weight of 10,780.

The final concentration of DMSO is 14% and the  
15 final concentration of glycerol is 18%. The test compound  
is dissolved in DMSO and diluted in DMSO to 10x the test  
concentration; 10 $\mu$ l of the enzyme preparation is added,  
the materials mixed and then the mixture is incubated at  
ambient temperature for 15 minutes. The enzyme reaction  
20 is initiated by the addition of 40 $\mu$ l of substrate. The  
increase in fluorescence is monitored at 4 time points (0,  
8, 16 and 24 minutes) at ambient temperature. Each assay  
is carried out in duplicate wells.

25 The preceding examples can be repeated with  
similar success by substituting the generically or  
specifically described reactants and/or operating  
conditions of this invention for those used in the  
preceding examples.

EXAMPLE 61

The effectiveness of various compounds were determined in the above-described enzyme assay and in a CEM cell assay. The HIV inhibition assay method of acutely infected cells is an automated tetrazolium based colorimetric assay essentially that reported by Pauwles et al, *J. Virol. Methods*, 20, 309-321 (1988). Assays were performed in 96-well tissue culture plates. CEM cells, a CD4<sup>+</sup> cell line, were grown in RPMI-1640 medium

(Gibco) supplemented with a 10% fetal calf serum and were then treated with polybrene (2 $\mu$ g/ml). An 80  $\mu$ l volume of medium containing  $1 \times 10^4$  cells was dispensed into each well of the tissue culture plate. To each well was added 5 a 100 $\mu$ l volume of test compound dissolved in tissue culture medium (or medium without test compound as a control) to achieve the desired final concentration and the cells were incubated at 37°C for 1 hour. A frozen culture of HIV-1 was diluted in culture medium to a 10 concentration of  $5 \times 10^4$  TCID<sub>50</sub> per ml (TCID<sub>50</sub> = the dose of virus that infects 50% of cells in tissue culture), and a 20 $\mu$ L volume of the virus sample (containing 1000 TCID<sub>50</sub> of virus) was added to wells containing test compound and to wells containing only medium (infected 15 control cells). Several wells received culture medium without virus (uninfected control cells). Likewise, the intrinsic toxicity of the test compound was determined by adding medium without virus to several wells containing test compound. In summary, the tissue culture plates 20 contained the following experiments:

	Cells	Drug	Virus
25	1.	+	-
	2.	+	+
	3.	+	-
	4.	+	+

30 In experiments 2 and 4 the final concentrations of test compounds were 1, 10, 100 and 500  $\mu$ g/ml. Either azidothymidine (AZT) or dideoxyinosine (ddI) was included as a positive drug control. Test compounds were dissolved in DMSO and diluted into tissue culture medium 35 so that the final DMSO concentration did not exceed 1.5% in any case. DMSO was added to all control wells at an appropriate concentration.

Following the addition of virus, cells were incubated at 37°C in a humidified, 5% CO<sub>2</sub> atmosphere for 7 days. Test compounds could be added on days 0, 2 and 5 if desired. On day 7, post-infection, the cells in each 5 well were resuspended and a 100µl sample of each cell suspension was removed for assay. A 20µL volume of a 5 mg/ml solution of 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) was added to each 100µL cell suspension, and the cells were incubated for 4 hours 10 at 27°C in a 5% CO<sub>2</sub> environment. During this incubation, MTT is metabolically reduced by living cells resulting in the production in the cell of a colored formazan product. To each sample was added 100µl of 10% sodium dodecylsulfate in 0.01 N HCl to lyse the cells, and 15 samples were incubated overnight. The absorbance at 590 nm was determined for each sample using a Molecular Devices microplate reader. Absorbance values for each set of wells is compared to assess viral control infection, uninfected control cell response as well as 20 test compound by cytotoxicity and antiviral efficacy.

The compounds of the present invention are effective antiviral compounds and, in particular, are effective retroviral inhibitors as shown above. Thus, the subject compounds are effective HIV protease inhibitors.

5 It is contemplated that the subject compounds will also inhibit other retroviruses such as other lentiviruses in particular other strains of HIV, e.g. HIV-2, human T-cell leukemia virus, respiratory syncitial virus, simian immunodeficiency virus, feline leukemia virus, feline 10 immuno-deficiency virus, hepadnavirus, cytomegalovirus and picornavirus. Thus, the subject compounds are effective in the treatment, prophylaxis of retroviral infections and/or the prevention of the spread of retroviral infections.

15 The subject compounds are also effective in preventing the growth of retroviruses in a solution. Both human and animal cell cultures, such as T-lymphocyte cultures, are utilized for a variety of well known purposes, such as research and diagnostic procedures 20 including calibrators and controls. Prior to and during the growth and storage of a cell culture, the subject compounds may be added to the cell culture medium at an effective concentration to prevent the unexpected or undesired replication of a retrovirus that may 25 inadvertently, unknowingly or knowingly be present in the cell culture. The virus may be present originally in the cell culture, for example HIV is known to be present in human T-lymphocytes long before it is detectable in blood, or through exposure to the virus. This use of the 30 subject compounds prevents the unknowing or inadvertent exposure of a potentially lethal retrovirus to a researcher or clinician.

Compounds of the present invention can possess 35 one or more asymmetric carbon atoms and are thus capable of existing in the form of optical isomers as well as in the form of racemic or nonracemic mixtures thereof. The

optical isomers can be obtained by resolution of the racemic mixtures according to conventional processes, for example by formation of diastereoisomeric salts by treatment with an optically active acid or base.

5 Examples of appropriate acids are tartaric, diacetyltartaric, dibenzoyltartaric, ditoluoyltartaric and camphorsulfonic acid and then separation of the mixture of diastereoisomers by crystallization followed by liberation of the optically active bases from these  
10 salts. A different process for separation of optical isomers involves the use of a chiral chromatography column optimally chosen to maximize the separation of the enantiomers. Still another available method involves synthesis of covalent diastereoisomeric molecules by  
15 reacting compounds of Formula I with an optically pure acid in an activated form or an optically pure isocyanate. The synthesized diastereoisomers can be separated by conventional means such as chromatography, distillation, crystallization or sublimation, and then  
20 hydrolyzed to deliver the enantiomerically pure compound. The optically active compounds of Formula I can likewise be obtained by utilizing optically active starting materials. These isomers may be in the form of a free acid, a free base, an ester or a salt.

25

The compounds of the present invention can be used in the form of salts derived from inorganic or organic acids. These salts include but are not limited to the following: acetate, adipate, alginate, citrate, 30 aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, cyclopentanepropionate, dodecylsulfate, ethanesulfonate, glucoheptanoate, glycerophosphate, hemisulfate, heptanoate, hexanoate, fumarate, hydrochloride, 35 hydrobromide, hydroiodide, 2-hydroxy-ethanesulfonate, lactate, maleate, methanesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, palmoate, pectinate,

persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, tosylate, mesylate and undecanoate. Also, the basic nitrogen-containing groups can be quaternized with such agents as 5 lower alkyl halides, such as methyl, ethyl, propyl, and butyl chloride, bromides, and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl, and diamyl sulfates, long chain halides such as decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides, aralkyl halides 10 like benzyl and phenethyl bromides, and others. Water or oil-soluble or dispersible products are thereby obtained.

Other examples include salts with alkali metals or alkaline earth metals, such as sodium, potassium, calcium or 20 magnesium or with organic bases.

Total daily dose administered to a host in single or divided doses may be in amounts, for example, from 0.001 to 10 mg/kg body weight daily and more usually 0.01 to 1 25 mg. Dosage unit compositions may contain such amounts of submultiples thereof to make up the daily dose.

The amount of active ingredient that may be combined with the carrier materials to produce a single 30 dosage form will vary depending upon the host treated and the particular mode of administration.

The dosage regimen for treating a disease condition with the compounds and/or compositions of this 35 invention is selected in accordance with a variety of factors, including the type, age, weight, sex, diet and medical condition of the patient, the severity of the

disease, the route of administration, pharmacological considerations such as the activity, efficacy, pharmacokinetic and toxicology profiles of the particular compound employed, whether a drug delivery system is

5 utilized and whether the compound is administered as part of a drug combination. Thus, the dosage regimen actually employed may vary widely and therefore may deviate from the preferred dosage regimen set forth above.

10 The compounds of the present invention may be administered orally, parenterally, by inhalation spray, rectally, or topically in dosage unit formulations containing conventional nontoxic pharmaceutically acceptable carriers, adjuvants, and vehicles as desired.

15 Topical administration may also involve the use of transdermal administration such as transdermal patches or iontophoresis devices. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection, or infusion

20 techniques. Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions may be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile

25 injectable solution or suspension in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution, and isotonic sodium chloride solution.

30 In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of

35 injectables.

Suppositories for rectal administration of the drug can be prepared by mixing the drug with a suitable

nonirritating excipient such as cocoa butter and polyethylene glycols which are solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum and release the drug.

5

Solid dosage forms for oral administration may include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound may be admixed with at least one inert diluent such as sucrose 10 lactose or starch. Such dosage forms may also comprise, as in normal practice, additional substances other than inert diluents, e.g., lubricating agents such as magnesium stearate. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering 15 agents. Tablets and pills can additionally be prepared with enteric coatings.

Liquid dosage forms for oral administration may include pharmaceutically acceptable emulsions, solutions, 20 suspensions, syrups, and elixirs containing inert diluents commonly used in the art, such as water. Such compositions may also comprise adjuvants, such as wetting agents, emulsifying and suspending agents, and sweetening, flavoring, and perfuming agents.

25

While the compounds of the invention can be administered as the sole active pharmaceutical agent, they can also be used in combination with one or more immunomodulators, antiviral agents or other antiinfective 30 agents. For example, the compounds of the invention can be administered in combination with AZT, DDI, DDC or with glucosidase inhibitors, such as N-butyl-1-deoxyojirimycin or prodrugs thereof, for the prophylaxis and/or treatment of AIDS. When administered as a combination, the therapeutic 35 agents can be formulated as separate compositions which are given at the same time or different times, or the therapeutic agents can be given as a single composition.

The foregoing is merely illustrative of the invention and is not intended to limit the invention to the disclosed compounds. Variations and changes which are obvious to one skilled in the art are intended to be 5 within the scope and nature of the invention which are defined in the appended claims. From the foregoing description, one skilled in the art can easily ascertain the essential characteristics of this invention, and without departing from the spirit and scope thereof, can 10 make various changes and modifications of the invention to adapt it to various usages and conditions.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US96/02684

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  
Please see Further Information sheet enclosed.
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.
